

Technology Stack

IntelliForceAI — Enterprise Web Platform

Prepared: August 4, 2026

Core Framework

The foundation the entire application is built on.

TECHNOLOGY	VERSION	DESCRIPTION
Next.js	15.1.6	React framework using the App Router. Configured for 100% static export, meaning the entire site is pre-built into plain HTML/CSS/JS files with no server-side runtime required to operate it.
React	19.0.0	The underlying UI library powering all interactive components — cards, modals, forms, navigation, carousels, and section layouts.
TypeScript	5.7.3	Strict-mode typed superset of JavaScript. Catches structural/type errors at build time rather than in production, improving reliability and long-term maintainability.

Styling & Design System

How the visual look, theming, and responsive layout are implemented.

TECHNOLOGY	VERSION	DESCRIPTION
Tailwind CSS	3.4.17	Utility-first CSS framework used for all layout, spacing, color, and responsive breakpoints across the site, ensuring visual consistency without hand-written custom CSS per page.
PostCSS + Autoprefixer	8.5.1	Post-processes the compiled CSS to automatically add vendor prefixes, guaranteeing consistent rendering across different browsers.
Custom Design Tokens	—	HSL-variable based theming system supporting glassmorphism cards, dark mode (default) and light mode, driven by CSS custom properties defined centrally.

Animation & Interaction

Libraries responsible for motion, transitions, and iconography.

TECHNOLOGY	VERSION	DESCRIPTION
Framer Motion	12.0.0	Declarative animation library used for component-level transitions — dropdown menus, accordion expand/collapse, page-load reveals, and interactive hover states.
GSAP	3.12.5	High-performance animation engine used for more advanced sequences: the homepage hero's particle mesh background and animated statistic counters.
Lucide React	0.474.0	A consistent, lightweight SVG icon set used throughout the navigation, cards, and section headers.

Supporting Utilities

- **clsx** — a small utility for conditionally combining CSS class names based on component state (e.g. active/hover/disabled).
- **tailwind-merge** — resolves conflicting Tailwind utility classes so component overrides apply predictably.

Architecture & Hosting

How the site is built, packaged, and deployed.

- **Static Export** (`output: 'export'`) — the site compiles down to plain static files, requiring no Node.js server, database, or backend runtime in production.
- **cPanel Shared Hosting Compatible** — the build output deploys directly into a standard `public_html/` directory on ordinary shared web hosting.
- **Apache .htaccess** — configures security response headers (Content-Security-Policy, HSTS, X-Frame-Options), browser caching rules, and gzip/brotli compression.
- **PHP Contact Form Backend** (`contact.php`) — a lightweight static-hosting-compatible mail handler for the contact form, including a honeypot field to deter automated spam submissions.

SEO & Analytics

Discoverability, structured data, and traffic/behavior tracking.

- **JSON-LD Structured Data** — machine-readable Organization schema embedded in every page to improve how search engines represent the company in results.
- **OpenGraph Metadata, sitemap.xml, robots.txt** — standard SEO and social-sharing infrastructure generated automatically for every route.

- **Analytics Integrations** — pluggable support for Google Analytics 4, Microsoft Clarity, Plausible Analytics, and Cloudflare Web Analytics.
- **GDPR Cookie Consent** — a compliant cookie banner that gates optional analytics/tracking scripts behind explicit user consent.

Accessibility & Internationalization

- **WCAG 2.2 AA Compliance** — skip-to-content links, visible focus rings, and reduced-motion handling for users with motion sensitivity.
- **Client-side i18n** — English and Bangla language support with a locale switcher, driven by a central translation dictionary.

Development Tooling & Quality Assurance

- **ESLint** (with `eslint-config-next`) — enforces code quality and catches common bugs during development.
- **Prettier** — automatic, consistent code formatting across the entire codebase.
- **Custom QA Audit Script** (`scripts/qa-audit.mjs`) — an automated Node.js script that verifies the static build output before deployment.

Document generated for internal technical reference. Reflects the technology stack as implemented in the project repository.
